| Title: Mining and Quarrying Equipment Emission Inventory for CAPCOG counties plus Milam County | Report Date: January 16 th , 2013 | |
| Authors: AACOG Natural Resources/ Transportation Department | Type of Report: Technical Report | |
| Performing Organization Name & Address: Alamo Area Council of Governments 8700 Tesoro Drive, Suite 700 San Antonio, Texas 78217 | Period Covered: 2006 and 2008 | |
| Sponsoring Agency: Capital Area Council of Governments Austin, Texas | | |
| Abstract: Refinements were made to the 2006 and 2008 quarry and mining non-road equipment emissions inventories published by TCEQ for the area covered by the CAPCOG counties as well as Milam County. Population counts from aerial imagery of the CAPCOG region and Milam County, and data from the 2011 quarry survey in the San Antonio region were used to update emissions estimates. VOC, NO _x , and CO emission factors, and load factors used in the calculations are based on data in the TexN Model 1.6. Daily ozone season emissions from quarry and mining equipment in 2006 were estimated to be 0.25 tons of VOC, 4.03 tons of NO _x , and 1.63 tons of CO in CAPCOG and Milam County. In 2008, estimated emissions from quarry and mining equipment were 0.23 tons of VOC, 3.51 tons of NO _x , and 1.56 tons of CO in CAPCOG and Milam County. Non-road equipment emissions from mining and quarrying operations are dominated by rock trucks and loaders, while rock processing equipment, dozers, and excavators are also significant emission sources. As expected, Williamson and Travis Counties had the highest quarry and mining non-road equipment emissions followed by Burnet, Fayette, and Hays Counties. Emissions were allocated to the 4km photochemical model grid system, converted to the Emissions Processing System version 3 (EPS3), and formatted to EPA's NIF format. | | |

1. INTRODUCTION

The Clean Air Act is the comprehensive federal law that regulates airborne emissions across the United States.¹ This law authorizes the U.S. Environmental Protection Agency (EPA) to establish National Ambient Air Quality Standards (NAAQS) to protect public health and the environment. Of the many air pollutants commonly found throughout the country, EPA has recognized six “criteria” pollutants that can injure health, harm the environment, and/or cause property damage. One of these criteria pollutants, ozone, is produced when volatile organic compounds (VOC) and nitrogen compounds (NO_x) react in the presence of sunlight.²

According to the EPA, “the health effects associated with ozone exposure include respiratory health problems ranging from decreased lung function and aggravated asthma to increased emergency department visits, hospital admissions and premature death. The environmental effects associated with seasonal exposure to ground-level ozone include adverse effects on sensitive vegetation, forests, and ecosystems.”³ Currently, the ozone primary standard, which is designed to protect human health, is set at 75 parts per billion (ppb). The secondary standard, which is designed to protect the environment, is the same as the primary standard.

Local and state agencies rely on such tools as emissions inventories (EI) that temporally and geographically describe chemical emission rates by source to support air quality planning activities in a region. The more accurate the EI, the more useful it is for modeling and planning purposes. Quarry and mining non-road equipment emissions in the CAPCOG region and Milam County were identified as EI categories that could be further refined through additional research and analysis. Not only will this benefit the planning process, but the refinements can improve understanding of how these sources create ozone precursor pollutants, allowing planners, political leaders, and industries to work together to protect health and the environment.

As a subsequent step in the process, the refined CAPCOG area and Milam County quarry and mining equipment emissions were formatted for input into the regional photochemical model and National Emissions Inventory (NEI) Input Format (NIF).

2. Inventory Pollutants

Ozone is a secondary pollutant because it forms as the result of chemical reactions between other pollutants, namely:

- NO_x
- VOC
- Carbon monoxide (CO)

Emission inventory data is one category of inputs used in photochemical modeling. These models help determine a regions ability to comply with the NAAQS, and their usefulness depends, in part, on accurately identifying and quantifying emission rates from these pollutants.

³ EPA, September 16, 2009. “Fact Sheet: EPA to Reconsider Ozone Pollution Standards”, p. 1. Available online: http://www.epa.gov/air/ozonepollution/pdfs/O3_Reconsideration_FACT%20SHEET_091609.pdf. Accessed 06/28/2010.

3. Geographic Area

Updates to the 2006 and 2008 non-road emission inventories were calculated for quarry and mining operations in the CAPCOG region, consisting of ten counties. These counties include: Bastrop, Blanco, Burnet, Caldwell, Fayette, Hays, Lee, Llano, Travis, and Williamson. In addition, quarry and mining activities Milam County were included in the emission inventory calculations (Figure 4-1).

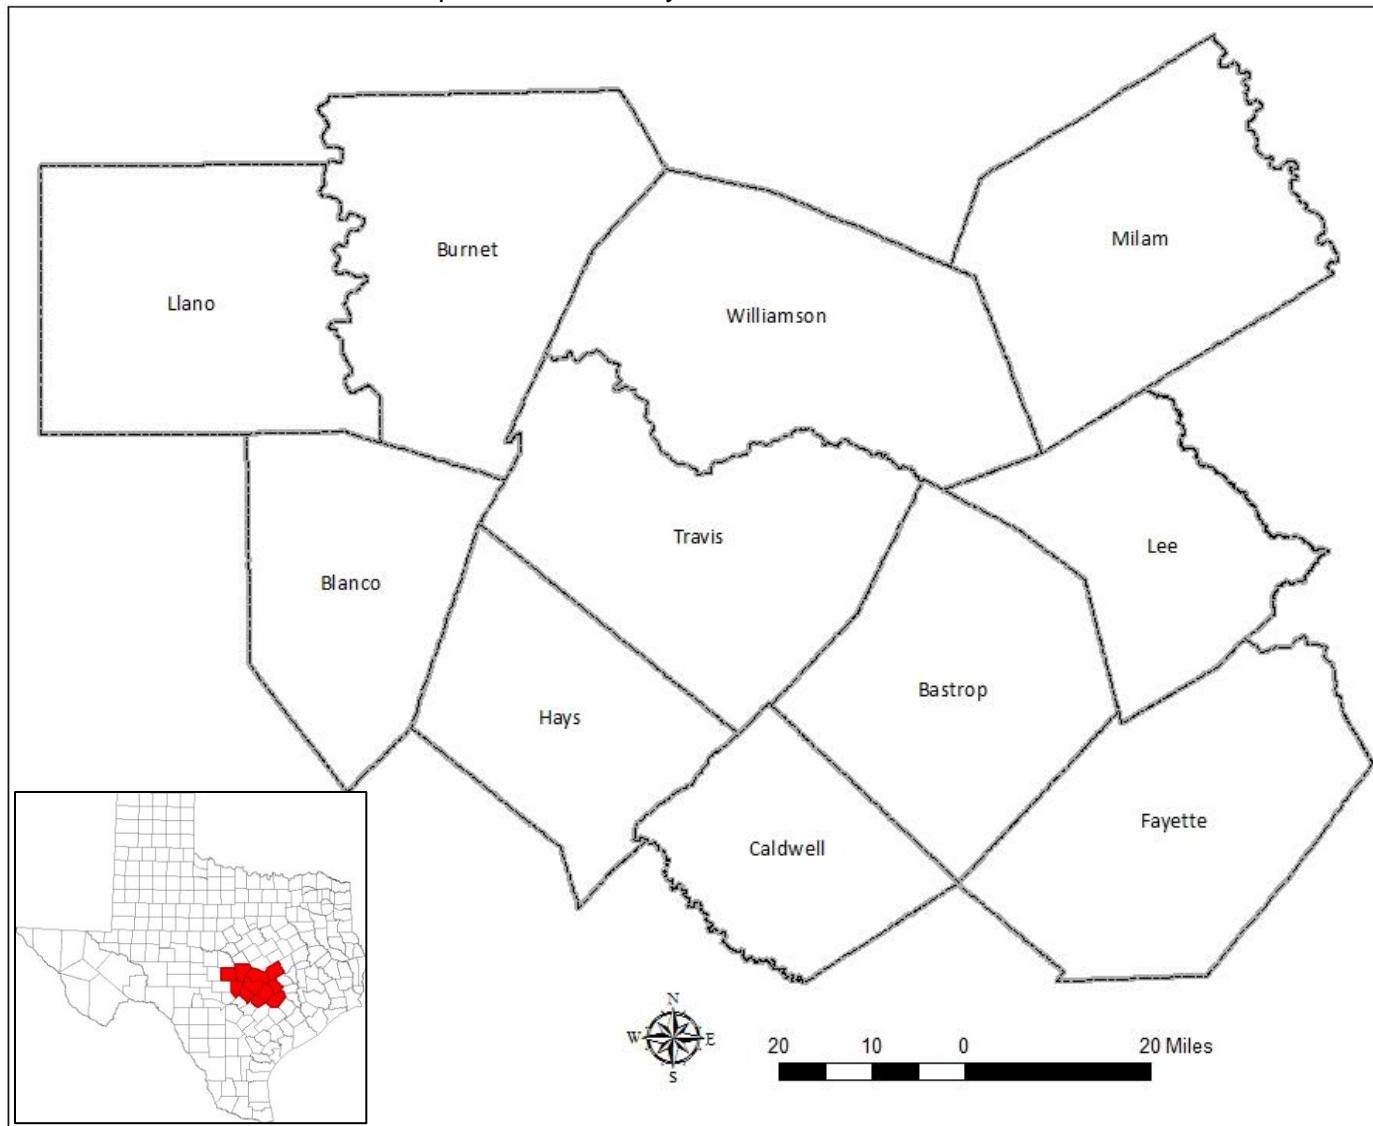

4. Modeling Domain Parameters

The development of input files for photochemical model emissions processing is based on a grid system consistent with EPA's Regional Planning Organizations (RPO) Lambert Conformal Conic map projection with the following parameters:

- First True Latitude (Alpha): 33°N
- Second True Latitude (Beta): 45°N
- Central Longitude (Gamma): 97°W
- Projection Origin: (97°W, 40°N)
- Spheroid: Perfect Sphere, Radius = 6,370 km

All future TCEQ photochemical model emissions processing work will be based on this grid system.

Figure 4-1: Location of CAPCOG counties plus Milam County

Plot Date: Dec. 19, 2012
Map Compilation: Dec. 19, 2012

5. Methodology

Due to the abundance of limestone, aggregate, granite, sand, gravel, and coal deposits, there are numerous quarries and mines in the CAPCOG region and Milam County. Large diesel non-road equipment is used to extract and haul deposits from these sites. Emissions were calculated for the following diesel quarry equipment:

- Rollers
- Scrapers
- Bore/Drill Rigs
- Excavators
- Cranes
- Graders
- Rock Trucks
- Water Trucks
- Vacuum Trucks
- Rock Processing Equipment
- Loaders
- Backhoes
- Dozers
- Aerial Lifts
- Tractors
- Other Construction Equipment

Equipment population counts from aerial imagery and data from the 2011 quarry survey in the San Antonio region⁴ were used to calculate emissions from quarry and mining non-road equipment. The following steps were used to calculate emissions:

1. Identify and count equipment using available aerial imagery of quarries and mines
2. Determine equipment population for quarry sites without aerial imagery.
3. Apply horsepower and activity rates results from the San Antonio survey to quarry and mining non-road equipment in CAPCOG and Milam County.
4. Calculate ozone precursor emissions using TexN 1.6 Model load and emission factors.
5. Calculate weekly adjustment factor for diesel quarry equipment based on AACOG's 2011 survey.
6. Allocate diesel quarry equipment emissions to the 4km photochemical model grid system.
7. Format 2008 emission inventory results in EPA's NIF format
8. Provide updated data to TCEQ in electronic format that can be readily included in the TexN Model by Diesel Construction Equipment (DCE) subsector.

There are 66 operating quarries and mines in the CAPCOG and Milam counties that are large enough to use heavy construction equipment on a regular basis.

- Bastrop 6 Quarries
- Blanco 0 Quarries
- Burnet 9 Quarries
- Caldwell 0 Quarries
- Fayette 10 Quarries
- Hays 4 Quarries
- Lee 0 Quarries
- Llano 3 Quarries
- Travis 10 Quarries
- Williamson 20 Quarries
- Milam 4 Quarries

⁴ Alamo Area Council of Governments, July 1st, 2012. "Non-Road Emission Inventory Improvements". San Antonio, Texas. Available online: <http://www.aacog.com/DocumentCenter/View/6546>. Accessed 12/27/2012.

5.1. Analysis of Aerial Photography

Aerial photographs were studied to provide equipment population counts for quarries and mines in the region. Equipment for each location was identified, marked, and counted on the aerial photographs. For example, the aerial photography of one of the quarries in Travis County shows there were 3 excavators, 1 crane, 3 off-highway rock trucks, and 8 rubber tire loaders in operation. Figure 3-1 shows an example of an aerial photo for a quarry that was used to identify specific equipment. In this aerial photograph, 2 rock trucks, 2 rubber-tire loaders, one backhoe, one tractor, and one rock crusher were identified.

When the counts of non-road equipment were completed, results for quarry and mining equipment were similar for both AACOG and CAPCOG regions (Table 5-1). On average, there were 3.14 pieces of equipment per 10,000 hours of operation in the AACOG region and 3.15 pieces of equipment per 10,000 hours of operation in the CAPCOG region. CAPCOG quarries and mines had more excavators and tractors, while quarries in the AACOG region had more drill rigs and cranes.

Table 5-1: Quarry Equipment Ratio per 10,000 Hours of Operation

| Equipment Type | SCC | AACOG Counties | CAPCOG + Milam Counties | Combined |
|--------------------------|------------|----------------|-------------------------|----------|
| Rollers | 2270002015 | 0.01 | 0.02 | 0.02 |
| Scrapers | 2270002018 | 0.05 | 0.07 | 0.06 |
| Bore/Drill Rigs | 2270002033 | 0.12 | 0.04 | 0.07 |
| Excavators | 2270002036 | 0.25 | 0.34 | 0.30 |
| Cranes | 2270002045 | 0.14 | 0.08 | 0.11 |
| Graders | 2270002048 | 0.10 | 0.14 | 0.13 |
| Off-Road Trucks | 2270002051 | 0.85 | 0.81 | 0.82 |
| Water Trucks | 2270002051 | 0.08 | 0.09 | 0.09 |
| Rock Crushers/Separators | 2270002054 | | N/A | |
| Loaders | 2270002060 | 1.10 | 0.94 | 1.01 |
| Backhoes | 2270002066 | 0.10 | 0.11 | 0.11 |
| Dozers/Tractors | 2270002069 | 0.23 | 0.21 | 0.22 |
| Tractors | 2270002075 | 0.00 | 0.14 | 0.08 |
| Other Construction Eq. | 2270002081 | 0.00 | 0.05 | 0.03 |
| Aerial Lifts | 2270003010 | 0.09 | 0.11 | 0.10 |

N/A – Ratios for Rock Crushers/Separators were not calculated because population counts were only based on data in TCEQ's permit database

Figure 5-1: Aerial Photography of Quarry Equipment

5.2. Determining Equipment Population for Quarry Sites without Local Data

Equipment populations for quarries that did not have aerial imagery were estimated based on the number of hours worked by strip, quarry, and open pit workers reported to the Mine Safety and Health Administration⁵. Aerial imagery was not available for 15 quarries in the CAPCOG region; however they only account for 19% of quarry operating hours (Table 5-2). Most of the quarries without local aerial imagery were small quarries operating in Fayette County.

Table 5-2: Availability of Aerial Imagery for Quarries in CAPCOG and Milam Counties

| Data Availability | Number | | Operating Hours, 2006 | |
|---------------------------------|--------|---------|-----------------------|---------|
| | n | Percent | n | Percent |
| Quarries with Aerial Imagery | 51 | 77% | 1,790,435 | 81% |
| Quarries with no Aerial Imagery | 15 | 23% | 413,462 | 19% |
| Total | 68 | 100% | 2,203,897 | 100% |

A quarry operating hours to equipment ratio was calculated by dividing the total pieces of equipment counted in each category by the operation hours at these quarries for those quarries and mines for which the data was available from surveys and/or aerial photography. The ratio was then used to calculate estimated equipment populations for the remaining quarry sites without aerial imagery. The margin of error per 10,000 operating hours was marginal for those equipment types operating at most quarries: rock trucks and loaders (Table 5-3). Other equipment types have a significant margin of error because they are not located at all quarries: rollers, scrapers, aerial lifts, and drill rigs.

⁵ Mine Safety and Health Administration, Dec. 14, 2012. "Mine Data Retrieval System". United States Department of Labor. Available online: <http://www.msha.gov/drs/drshome.htm>. Accessed 12/18/2012.

Table 5-3: Quarry Equipment Ratio Statistics (AACOG, CAPCOG, and Milam counties combined)*

| Equipment Type | SCC | n | Standard Deviation | Low | Mean | High | Margin of Error |
|--------------------------|------------|-----|--------------------|-------|------|------|-----------------|
| Rollers | 2270002015 | 6 | 0.15 | -0.10 | 0.02 | 0.14 | 0.12 |
| Scrapers | 2270002018 | 19 | 0.16 | -0.01 | 0.06 | 0.14 | 0.07 |
| Bore/Drill Rigs | 2270002033 | 22 | 0.18 | 0.00 | 0.07 | 0.15 | 0.07 |
| Excavators | 2270002036 | 88 | 0.49 | 0.19 | 0.30 | 0.40 | 0.10 |
| Cranes | 2270002045 | 33 | 0.31 | 0.01 | 0.11 | 0.21 | 0.10 |
| Graders | 2270002048 | 38 | 0.35 | 0.02 | 0.13 | 0.24 | 0.11 |
| Off-Road Trucks | 2270002051 | 248 | 1.17 | 0.69 | 0.83 | 0.98 | 0.15 |
| Water Trucks | 2270002051 | 27 | 0.24 | 0.00 | 0.09 | 0.18 | 0.09 |
| Rock Crushers/Separators | 2270002054 | 30 | | | N/A | | |
| Loaders | 2270002060 | 298 | 1.14 | 0.87 | 1.00 | 1.13 | 0.13 |
| Backhoes | 2270002066 | 32 | 0.27 | 0.01 | 0.11 | 0.20 | 0.09 |
| Dozers/Tractors | 2270002069 | 65 | 0.35 | 0.13 | 0.22 | 0.30 | 0.09 |

| Other Construction Eq. | 2270002081 | 7 | 0.08 | -0.03 | 0.02 | 0.08 | 0.06 |
| Aerial Lifts | 2270003010 | 30 | 0.32 | -0.01 | 0.10 | 0.22 | 0.12 |

*Only for Quarries with more than 10,000 quarry hours

N/A - Rock Crushers and separators population counts came only from TCEQ permit database

Equation 5-1 documents the formula used to determine the equipment ratio per 10,000 work hours, while Equation 5-2 was used to calculate equipment counts at quarries without aerial imagery. Although there is a large margin of error for some of the equipment that is not used by all quarries, the calculated ratios are only used for the 15 quarries that did not have aerial imagery.

Equation 5-1, Equipment to hours ratio for quarries without local data

$$HRATIO_A = EP_A / \text{Hours} \times 10,000 \text{ hours}$$

Where,

$HRATIO_A$ = Equipment to hours operated ratio for equipment type A

EP_A = Equipment population for equipment type A (from survey data in the AACOG region and aerial imagery in both CAPCOG and AACOG regions)

Hours = Number of hours worked by strip, quarry, and open pit workers in AACOG, CAPCOG, and Milam County for sites with aerial imagery or survey data in 2011⁶, 3,032,600 (from Mine Safety and Health Administration)

Sample Equation – Equipment to hours operated ratio for loaders

$$\begin{aligned} HRATIO_A &= 307 \text{ loaders} / 3,032,600 \text{ hours} \times 10,000 \text{ hours} \\ &= 1.01 \text{ loaders per 10,000 hours of operation} \end{aligned}$$

Equation 5-2, Equipment population at each quarry without local data

$$POP_{AB} = EMP_A \times HRATIO_A / 10,000 \text{ hours}$$

Where,

POP_{AB} = Estimated population of equipment for equipment type A at quarry B

EMP_B = Number of hours worked by strip, quarry, and open pit workers at quarry B in 2006 or 2008 (from Mine Safety and Health Administration)

$HRATIO_A$ = Equipment to hours operated ratio for equipment type A (from equation 3-2 provided in Table 5-1)

Sample Equation – Number of loaders operating at quarry B

$$\begin{aligned} POP_{AB} &= 36,741 \text{ hours operated by quarry B} \times 1.01 \text{ Rubber Tire Loaders} / 10,000 \text{ hours} \\ &= 4 \text{ loaders at quarry B} \end{aligned}$$

Quarry and mining equipment counts for the CAPCOG plus Milam County region and a comparison to the TexN Model 1.6 default data is provided in Table 5-4. Aerial imagery indicates that population counts for several equipment types were lower, than the default equipment settings in the TexN Model. Specifically, there were fewer excavators, graders, loaders, and dozers operating at quarries and mines in the CAPCOG and Milam County regions than listed in the model. Some of the less common equipment types, bore drill rigs, cranes, aerial lifts, tractors, and rock processing equipment, are not reported in the mining and quarry DCE subsector of the model and some of the default equipment populations are set at zero.

⁶ Note: 2011 employment data was used because 2011 aerial imagery was used to count equipment population

Table 5-4: Quarry Equipment Counts for the CAPCOG counties plus Milam County

| Equipment Type | SCC | TexN Model DCE #23 Mining & Quarry (2006) | CAPCOG 2006 | CAPCOG 2008 |
|------------------------|------------|---|----------------|----------------|
| Rollers | 2270002015 | * | 5 | 5 |
| Scrapers | 2270002018 | 33 | 15 | 16 |
| Bore/Drill Rigs | 2270002033 | * | 9 | 9 |
| Excavators | 2270002036 | 120 | 78 | 79 |

| Aerial Lifts | 2270003010 | * | 24 | 24 |
| Tractors | 2270002075 | * | 29 | 29 |
| Other Construction Eq. | 2270002081 | * | 9 | 9 |

*Not included in the DCE #23 Mining & Quarry subsector and the TexN Model does not break down bore/drill rigs and cranes into individual DCE subsectors

As shown in Table 5-5 and Table 5-6, Williamson County had the largest population of quarry equipment followed by Travis and Burnet Counties. Significant numbers of quarry and mining equipment also operate in Hays, Fayette, and Milam counties, while there was no quarry or mining equipment operating in Blanco and Caldwell counties. Overall there were 730 pieces of quarry and mining equipment operating in 2006, and 741 pieces of quarry and mining equipment operating in 2008.

Table 5-5: Quarry and Mining Equipment Counts by County, 2006

| Equipment Type | SCC | Bastrop | Blanco | Burnet | Caldwell | Fayette | Hays | Lee | Llano | Travis | Williamson | Milam | Total |

5.3. Determine Activity Rates and Horsepower for Quarry and Mining Equipment in the CAPCOG region

Quarry and mining equipment activity rates and horsepower are based on a 2011 survey conducted in the AACOG region. Fifteen cement/limestone quarries, seven sand/gravel, and 1 gypsum quarry responded to the survey in the AACOG region. CAPCOG had more Dimension stone compared to the AACOG region (Table 5-7).

Table 5-7: Employment by Mined Material for AACOG and CAPCOG regions, 2011

| Mined Material | AACOG Region | | | CAPCOG & Milam County | | |
|-----------------------|--------------|-----------|---------|-----------------------|-----------|---------|
| | Number | Hours | Percent | Number | Hours | Percent |
| Cement/Limestone/Lime | 35 | 1,319,703 | 54% | 22 | 545,861 | 25% |
| Sand/Gravel | 19 | 566,485 | 23% | 23 | 688,779 | 31% |
| Dimension Stone | 9 | 66,225 | 3% | 15 | 523,981 | 24% |
| Coal | 1 | 480,243 | 20% | 1 | 425,503 | 19% |
| Clay | 1 | 5,477 | 0% | 5 | 19,776 | 1% |
| Gypsum | 1 | 19,529 | 1% | 0 | 0 | 0% |
| Total | 66 | 2,457,663 | 100% | 66 | 2,203,900 | 100% |

Table 5-8 shows that most quarry and mining equipment, such as scrapers, bore/drill rigs, graders, rock trucks, and loaders, operate longer hours at regional quarries than what is reported in the TexN Model. . Several equipment types operating at Austin area quarries are not included in DCE subsector #23 for mining and quarries including rollers, rock processing equipment, aerial lifts, and tractors. Data on tractors and other construction equipment operating at quarries and mines in the Austin region were not available from the AACOG survey. Consequently, activity rates and horsepower from the TexN model were used to calculate emissions for tractors and other construction equipment.

Table 5-9 lists the reported horsepower for quarry equipment from AACOG's 2011 survey and previous emission inventories. Horsepower ratings for bore/drill rigs, rock trucks and dozers were found to be higher than results from previous studies and existing data in the TexN Model, while horsepower ratings for graders were lower. Horsepower data for excavator were significantly lower than previous studies, except for results documented by ERG in their 2009 equipment analysis for Texas.⁷

The most common equipment types at quarries are front end loaders and rock trucks, followed by excavators and dozers. To determine the error bounds of quarry equipment survey results, an analysis of activity and horsepower responses was conducted. A 95% level of confidence ($p = 0.05$) was used for equipment types with 5 or more observations in Table 5-10. The results assume that the means are normally distributed. The most common equipment types reported had the lowest percent margin of error for activity rates and horsepower. Loaders and rock trucks had the lowest percent margin of error because they are used by most quarries: less than 9% for both activity and horsepower. Other common equipment types, dozers and excavator also had a low percent margin of error. Equipment that had a high margin of error for activity rates, bore drill rigs, cranes, graders, and aerial lifts, are only operated at a few quarries. Equipment horsepower can vary greatly even at the same quarry depending on the need and what equipment is available at the time.

Table 5-10: Confidence Interval at 95% for Quarry Equipment from AACOG's 2011 Survey

| Equipment Type | SCC | Parameter | n | Mean | + / - | Percent of Mean |

| | | Horsepower | 8 | 200 | 44 | 21.8% |
| Graders | 2270002048 | Hours/Year | 11 | 762 | 431 | 56.5% |
| | | Horsepower | 10 | 142 | 17 | 12.2% |
| Rock trucks | 2270002051 | Hours/Year | 71 | 2,288 | 171 | 7.5% |
| | | Horsepower | 63 | 529 | 46 | 8.8% |
| Water Trucks | 2270002051 | Hours/Year | 10 | 1,780 | 474 | 26.6% |
| | | Horsepower | 10 | 304 | 76 | 24.8% |
| Loaders | 2270002060 | Hours/Year | 90 | 2,377 | 191 | 8.0% |
| | | Horsepower | 77 | 382 | 28 | 7.2% |
| Backhoes | 2270002066 | Hours/Year | 18 | 814 | 161 | 19.7% |
| | | Horsepower | 12 | 97 | 28 | 29.5% |
| Dozers | 2270002069 | Hours/Year | 26 | 1,713 | 310 | 18.1% |
| | | Horsepower | 23 | 483 | 81 | 16.8% |
| Aerial Lifts | 2270003010 | Hours/Year | 7 | 1,364 | 765 | 56.0% |
| | | Horsepower | 7 | 59 | 16 | 27.6% |

Survey responses for annual hours (Table 5-11) and horsepower (Table 5-12) were compared between Cement/Limestone and Sand/Gravel quarries. Annual hours were similar for excavators, graders, and backhoes between the two types of quarries. However, annual hours were higher for rock trucks, loaders, and dozers for cement/limestone quarries. Similarly, rock trucks, loaders, and dozer operating at cement/limestone quarries have higher horsepower than at sand/gravel quarries. While the CAPCOG region has a significant number of dimension stone quarries, no dimensional stone quarries responded to the 2011 survey in the AACOG region.

Several quarries have a rock crusher and/or a rock separator located on site, but most rock processing equipment are electric. However, there are several diesel powered rock crushers and separators operating at quarries in rural areas. TCEQ's permit database identified 13 diesel powered rock processors at quarries in the CACPOG region and Milam County. The point source emission inventory was also checked to make sure emissions from rock processing equipment was not double counted.

There are 2 draglines operating at the Three Oaks Mine in Milam County. Dragline 79 and Dragline 80 have 102 and 115 cubic yard capacity. Both draglines are electric¹⁴ and are not included in the emission inventory because they do not emit ozone precursor emissions from combustion engines.

5.4. Calculate Ozone Precursor Emissions

The methodology used to estimate quarry and mining non-road equipment emissions incorporated information on horsepower and activity data extracted from the 2011 survey in the AACOG region and equipment population counts from aerial imagery. Existing data in the TexN Model 1.6 was updated with AACOG survey responses (Table 5-13) to estimate load and emission factors. The TexN Model run specifications were:

- Analysis Year = 2006 and 2008
- Max Tech. Year = 2006 and 2008
- Met Year = Typical Year
- Period = Ozone Season Day (OSD)
- Summation Type = Typical Day, Weekday
- Post Processing Adjustments = All
- Rules Enabled = All
- Regions = Travis County
- Sources = Diesel construction equipment

All current federal and state regulations are taken into account when calculating emissions. Horsepower and activity rates in the TexN model were updated with survey data from the AACOG region. A detailed list of the updates to TexN model horsepower bins are provided in Appendix C. VOC, NO_x, and CO emissions for 2006 and 2008 were calculated using the formula provided below.

Equation 5-3, Emissions from quarry or mining diesel equipment

$$QDE_A = (EP_A \times HRS_A \times HP_A \times LF_A \times EF_A) / 907,184.74 \text{ grams/ton} / 365 \text{ days/year}$$

Where:

- QDE_A = Emissions for equipment type A, tons of NO_x, VOC, or CO per ozone season day
 EP_A = Equipment population for equipment type A (from aerial imagery or Equation 5-2)
 HRS_A = Annual hours of operation for equipment type A (from AACOG's 2011 survey)
 HP_A = Average rated horsepower for equipment type A (from AACOG's 2011 survey)
 LF_A = Typical load factor for equipment type A (from TexN Model, Table 5-13)

¹⁴ US Army Corps of Engineers, Fort Worth District, May 2003. "Three Oaks Mine, Final Impact Statement Volume I". Fort Worth Texas. p. 2-32. Available online: <http://media.swf.usace.army.mil/pubdata/notices/3oakpdf/Voll-sec1-beginning-pg3-22.pdf>. Accessed 12/27/2012.

EF_A = NO_x, VOC, or CO emission factor for equipment type A (from TexN Model, Table 5-13)

Sample equation – ozone season day 2006 NO_x emissions for front end loaders operating at a quarry in Hays County

$$\begin{aligned} QDE_A &= (3 \text{ loaders} \times 2,377 \text{ hours for each loader} \times 382 \text{ hp} \times 0.59 \times 3.829 \text{ grams of NO}_x \\ &\quad \text{per hour}) / 907,184.74 \text{ grams/ton} / 365 \text{ days/year} \\ &= 0.01861 \text{ tons of NO}_x \text{ per ozone season day} \end{aligned}$$

Figure 5-2 and Figure 5-3 provide emission results by equipment type for 2006 and 2008, while Figure 5-4 and Figure 5-5 show emission totals by county. Ozone season day 2006 emissions from quarry and mining equipment were 0.252 tons of VOC, 4.028 tons of NO_x, and 1.626 tons of CO in the CAPCOG and Milam County region. In 2008, there were 0.233 tons of VOC, 3.505 tons of NO_x, and 1.564 tons of CO in the CAPCOG and Milam County region from quarry and mining non-road equipment.

Emissions are dominated by rock trucks and loaders, while rock processing equipment, dozers, and excavators are also significant emission sources. As expected, Williamson and Travis Counties had the highest quarry and mining non-road equipment emissions followed by Burnet, Hays, and Fayette Counties. Detailed lists of emissions by county and equipment type are provided in Appendix A for 2006 and Appendix B for 2008.

Future work on quarry and mining equipment can include using a two part survey similar to the one used in the AACOG region to update equipment populations, horsepower, and activity rates in the CAPCOG and Milam county region. A survey will also provide an improved estimation of emissions from rock processing equipment. The current methodology uses data from the TCEQ permit database and emissions may be over estimated.

5.1. Temporal Allocation

A weekday versus weekend adjustment factor was calculated based on the total hours of equipment operation for each time period from AACOG's 2011 survey. Weekend average activity hours are 29.6 percent of weekday average activity hours. The Emissions Preprocessor System (EPS3) TMPRL inputs used for the photochemical model were updated accordingly.

5.2. Spatial Allocation of Emissions

Emissions were spatially allocated to the 4-km photochemical grid system used in the June 2006 photochemical model. Emissions were geo-coded to the location of quarries identified through TCEQ Permits¹⁵, Mineral Locations Database¹⁶, Find the Best directory¹⁷, and aerial photographs. All 2006 and 2008 emissions were converted to AFS formatting used by EPS3, and 2008 emissions were also converted to EPA's NIF formatting.
